

Ski manufacturers know that slick graphics are essential to make their brand stand out in today's competitive environment. Scapa 1288 protection tape allows you to achieve the premium graphics from sublimation printing, while protecting your ski surfaces during this heat-intensive process.

A new level of ski graphics

- Scapa 1288 ensures that your ski materials remain intact during the sublimation process, by protecting them from even the highest temperatures.
- You achieve better quality and more detailed graphics for improved brand recognition.
- The deeper layering of the colours results in a long lasting message to the user, even after scratching of the ski surface.

Improving speed and saving costs in your processes

- Your process speed is improved, as Scapa 1288 remains transparent throughout the process, allowing for easy inspection.
- Save time and costs at the final stage of production, as Scapa 1288 can be removed in one piece, leaving the ski surface clean and shiny.
- No more costly cleaning after tape removal - Scapa's 1288 unique adhesive formulation is residue and silicone free.

The radical way to achieve a new level of ski graphics
